SAFEWEB / FRONTEND INTERNSHIP REPORT

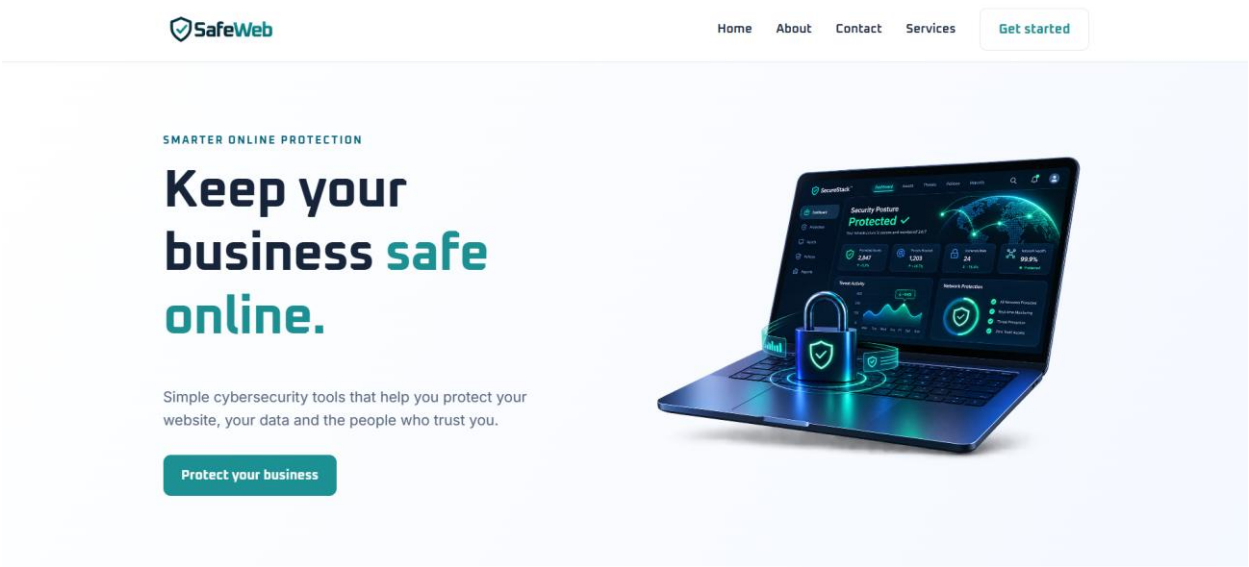

Name: Delaram Farzad | Registration: OCT26-FE26-34 | Date: 5 November 2026

1. Project overview

SafeWeb is a fictional cybersecurity SaaS landing page built using HTML5 and CSS3 only, without JavaScript. The goal was to create a responsive, accessible website with a consistent design system.

The page includes a header, hero section, four service cards, contact section, about section and footer. It is deployed on Vercel.

Live website: https://safeweb-landing-page.vercel.app/

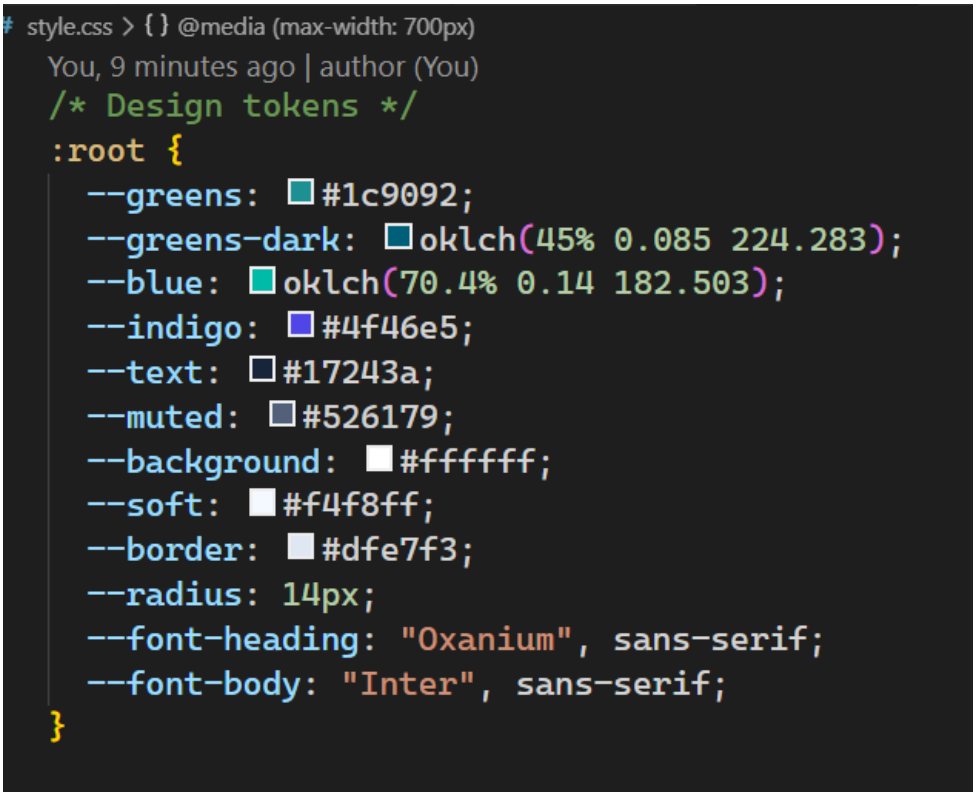

Desktop view: navigation, hero content and cybersecurity illustration.

2. CSS architecture and design tokens

I used CSS custom properties in :root for colours, typography, background, borders and border radius. This keeps repeated values consistent and makes updates easier. Headings use Oxanium and body text uses Inter.

The layout uses CSS Grid and Flexbox. Fluid typography uses clamp() so text can scale between suitable minimum and maximum sizes.

Icons are stored as reusable <symbol> definitions in an external SVG sprite and displayed with <use>. This avoids repeating the same SVG markup in the HTML.

Design tokens defined in the main CSS stylesheet.

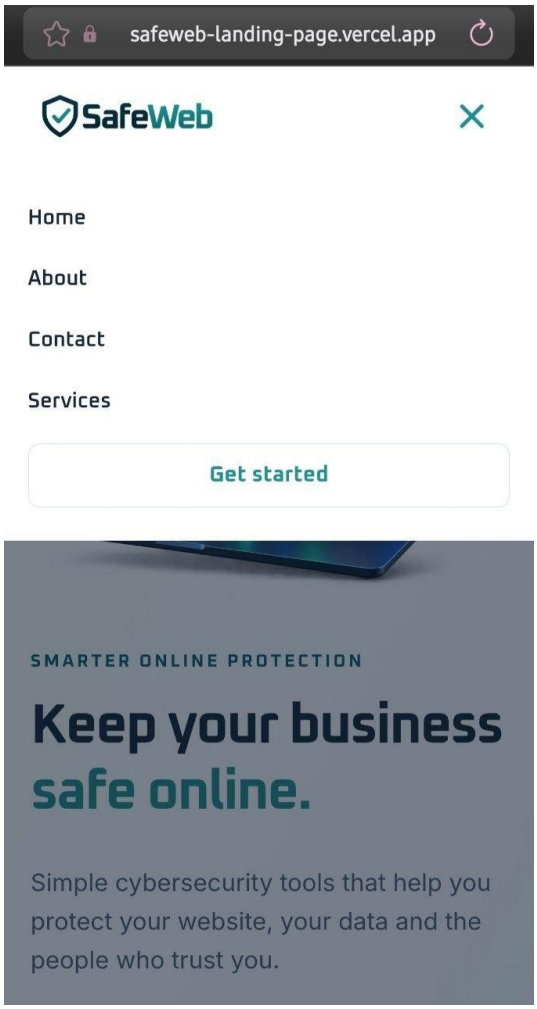

3. Accessibility and CSS-only navigation

Accessibility was considered throughout development:

- Semantic HTML with header, nav, main, section, footer and appropriate headings.
- A “Skip to content” link for keyboard users, with visible focus styling.
- Descriptive image alt text; decorative SVG icons hidden from assistive technology.
- Navigation labels and section headings connected with ARIA where needed.
- Reduced-motion support and improved text/button colour contrast.

Mobile menu

The mobile navigation uses the CSS checkbox hack: a visually hidden checkbox and its label control the menu, while the :checked selector shows or hides the links and backdrop. No JavaScript is required.

Mobile navigation expanded on a narrow screen.

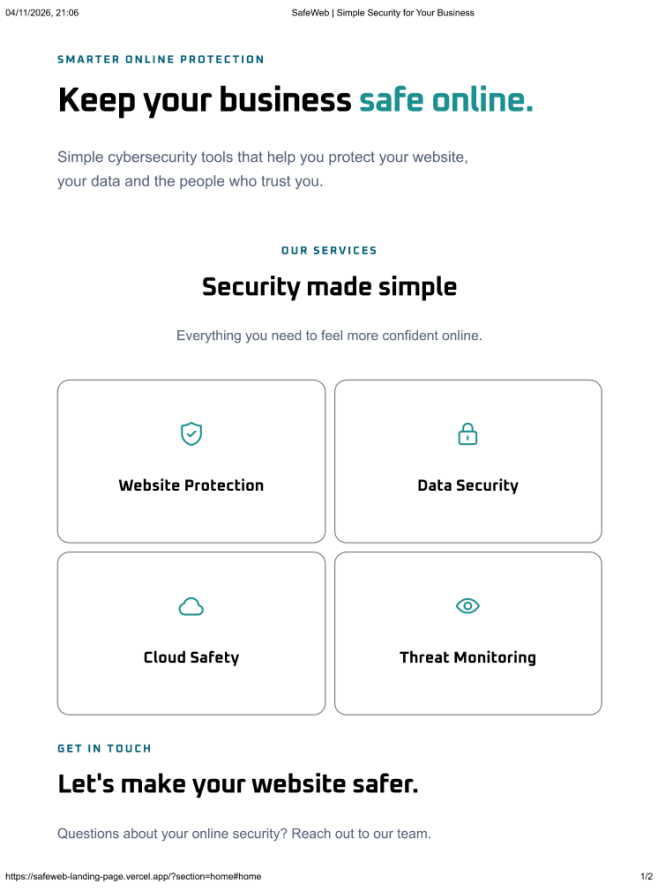

4. Responsive layout, animation and print CSS

Media queries adapt the layout for tablet and mobile screens. Grids change to fewer columns, navigation becomes a mobile menu, and the hero layout rearranges to fit smaller widths.

The page uses smooth anchor scrolling and CSS load-in animations for the hero content. A prefers-reduced-motion media query reduces or disables motion for users who request it.

Print stylesheet

A separate print.css file is loaded with media="print". It removes elements that are not useful on paper, including the navigation, footer, buttons and hero image. It also simplifies the layout, removes shadows, uses readable black text and gives content print-friendly spacing.

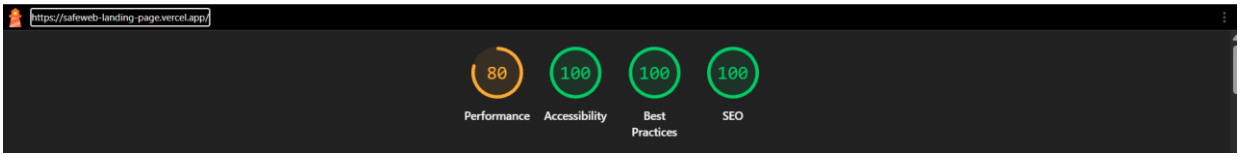

Browser print preview: simplified page layout without navigation or hero image.

5. Lighthouse testing and conclusion

I tested the deployed website with Chrome Lighthouse. After the accessibility audit identified low-contrast button text, I darkened the button backgrounds and retested. The Accessibility score increased from 96 to 100.

For performance, I converted the hero image from PNG to WebP to reduce image weight. The Performance score improved from 74 to 80 across subsequent tests. Other loading factors can still affect the score.

Final Lighthouse: Performance 80, Accessibility 100, Best Practices 100, SEO 100.

Conclusion

The project meets the required Lighthouse targets for Accessibility and Best Practices. It gave me practice in responsive CSS, reusable design tokens, accessibility checks, a JavaScript-free mobile menu, print styling and performance optimisation.
